# A General Communication Game

Imagine the following game between Sender & Receiver:

- Sender & Receiver agree on **code** for each outcome ahead of time (e.g., 0 for *Heads*; 1 for *Tails*)
- Sender observes outcomes then codes and sends message
- Receiver decodes message and recovers outcome sequence

<https://eduassistpro.github.io>

*Heads, Tails, Heads, ...*

**Goal:** Want small messages **on average** when outcomes are from a **fixed, known, but uncertain** source (e.g., coin flips with known bias)

# Assignment Project Exam Help

Consider a coin with  $P(\text{Heads}) = 0.9$ . If we want perfect transmission:

- Co

# Entropy and Information: Recap

## Ensemble

An **ensemble**  $X$  is a triple  $(x, \mathcal{A}_X, \mathcal{P}_X)$ ;  $x$  is a **random variable** taking values in  $\Omega_X = \{a_1, a_2, \dots, a_l\}$  with probabilities  $\mathcal{P}_X = \{p_1, p_2, \dots, p_l\}$

## Informa

The info  $I(x)$  is

$$h(a_i) = \log_2 \frac{1}{p_i} = -\log_2 p_i$$

# Entropy and Information: Recap

## Ensemble

An **ensemble**  $X$  is a triple  $(x, \mathcal{A}_X, \mathcal{P}_X)$ ;  $x$  is a **random variable** taking values in  $\mathcal{A}_X = \{a_1, a_2, \dots, a_I\}$  with probabilities  $\mathcal{P}_X = \{p_1, p_2, \dots, p_I\}$

## Informa

The **info**  $h(a_i)$  of  $X$  is

$$h(a_i) = \log_2 \frac{1}{p_i} = -\log_2 p_i$$

## Entropy

The **entropy** of an ensemble  $X$  is the average information

$$H(X) = \mathbb{E}[h(x)] = \sum_i p_i h(a_i) = \sum_i p_i \log_2 \frac{1}{p_i}$$

## What is a Code?

A source code is a process for assigning **names** to outcomes. The names are typically expressed by **strings of binary symbols**.

Assignment Project Exam Help

We will denote the set of all finite binary strings by

+ def

Source

Given an  $e : \mathcal{A}_X$ , **source code** for  $X$ . The number of symbols in  $c(x)$  is the **length** of  $x$ . The **extension** of  $c$  is defined by  $c(x_1 \dots x_n) = c(x_1) \dots c(x_n)$ .

Add WeChat edu\_assist\_pr

# What is a Code?

A source code is a process for assigning **names** to outcomes. The names are typically expressed by **strings of binary symbols**.

## Assignment Project Exam Help

We will denote the set of all finite binary strings by

+ def

### Source

Given an  $e : \mathcal{A}_X$ , **source code** for  $X$ . The number of symbols in  $c(x)$  is the **length** of  $c(x)$  or  $x$ . The **extension** of  $c$  is defined by  $c(x) : x$ .

### Example:

- The **code**  $c$  names outcomes from  $\mathcal{A}_X = \{r, g, b\}$  by  $c(r) = 00$ ,  $c(g) = 10$ ,  $c(b) = 11$
- The **length** of the codeword for each outcome is 2.
- The **extension** of  $c$  gives  $c(rgrb) = 00100011$

## Types of Codes

Let  $X$  be an ensemble and  $c: \mathcal{A}_X \rightarrow \{0, 1\}^+$  a code for  $X$ . We say  $c$  is a:

- Uniform Code if  $l(x)$  is the same for all  $x \in \mathcal{A}_X$
- Var

<https://eduassistpro.github.io>

## Types of Codes

Let  $X$  be an ensemble and  $c: \mathcal{A}_X \rightarrow \{0, 1\}^+$  a code for  $X$ . We say  $c$  is a:

- **Uniform Code** if  $l(x)$  is the same for all  $x \in \mathcal{A}_X$
- **Var**

Another if

be unambiguously determined given  $c(x)$ .

- **Lossless Code** if for all  $x_1, x_2 \in \mathcal{A}_X$  w  
 $c(x_1) \neq c(x_2)$
- **Lossy Code** otherwise

# Types of Codes

## Examples

**Examples:** Let  $A_X = \{a, b, c, d\}$

①  $c(a) = 00, c(b) = 01, c(c) = 10, c(d) = 11$  is uniform lossless

②  $c(a)$  lossless

③  $c(a) = 0, c(b) = 0, c(c) = 110, c(d) =$

④  $c(a) = 00, c(b) = 00, c(c) = 10, c(d) =$

⑤  $c(a) = -, c(b) = -, c(c) = 10, c(d) = 11$  is uniform lossy

## A Note on Lossy Codes & Missing Codewords

When talking about a uniform lossy code  $c$  for  $\mathcal{A}_X = \{a, b, c\}$  we write

**Assignment Project Exam Help**

where the symbol  $-$  means “no codeword”. This is shorthand for “the receiver

For the pur

**<https://eduassistpro.github.io>**

**Add WeChat edu\_assist\_pro**

$c(a) = 0 \quad c(b) = 1$

and the sender and receiver agreeing that the code  $-$  ways  
be decoded as  $b$

Assigning the outcome  $a_i$  the missing codeword “ $-$ ” just means “it is not possible to send  $a_i$  reliably”

# Lossless Coding

Example: Colours

## Assignment Project Exam Help

Three colour ensemble with  $\mathcal{A}_X = \{r, g, b\}$   
with  $r$  twice as likely as  $b$  or  $g$

Suppos

<https://eduassistpro.github.io>

$c(r) = 00$ ;  $c(g) = 10$ ; and  $c(b) = 11$

For example  $c(rgrbr) = 00001011001$

Add WeChat [edu\\_assist\\_pro](#)

On average, we will use  $I(r)p_r + I(g)p_g + I(b)p_b = 2$  bits per outcome

- $2N$  bits to code a sequence of  $N$  outcomes

## Raw Bit Content

Uniform coding gives a crude measure of information: the number of bits required to assign equal length codes to each symbol

### Raw Bit Content

If  $X$  is an ensemble with outcome set  $\mathcal{A}_X$  then its **raw bit content** is

$x$	$c$
a	000
b	001
c	010
d	011
e	100
f	101
g	110
h	111

This is a uniform encoding of o

$\mathcal{A}_X = \{a, b, c, d, e, f, g, h\}$

- Each outcome is encoded with 3 bits
- The probabilities of the outcomes are ignored
- Same as assuming a uniform distribution

For the purposes of compression, the exact codes don't matter – just the number of bits used.

# Lossy Coding

Example: Colours

## Assignment Project Exam Help

Three colour ensemble with  $\mathcal{X} = \{r, g, b\}$

- $p_r = 0.5$  and  $p_g = p_b = 0.25$ .

Exempl

$c(\text{rrrrrrrr}) = 0000000$ ;  $c(\text{rrbbrbr}) = 0$

Add WeChat edu\_assist\_pr

# Lossy Coding

Example: Colours

## Assignment Project Exam Help

Three colour ensemble with  $\mathcal{X} = \{r, g, b\}$

- $p_r = 0.5$  and  $p_g = p_b = 0.25$ .

<https://eduassistpro.github.io>

**Examp**

$c(\text{rrrrrrrr}) = 0000000$ ;  $c(\text{rrbbrbr}) = 0$

What is **probably** we can reliably code a sequence?

Given we can code a sequence of length  $N$ , **how many bits are expected?**

# Lossy Coding

Example: Colours

What is probability we can reliably code a sequence of  $N$  outcomes?

# Assignment Project Exam Help

$$P(x_1 \dots x_N \text{ has no } g) = P(x_1 \neq g) \dots P(x_N \neq g) = (1 - p_g)^N$$

<https://eduassistpro.github.io>

Add WeChat edu\_assist\_pr

# Lossy Coding

Example: Colours

What is probability we can reliably code a sequence of  $N$  outcomes?

$$P(x_1 \dots x_N \text{ has no } g) = P(x_1 \neq g) \dots P(x_N \neq g) = (1 - p_g)^N$$

Given we c

cted?

$$\mathbb{E}[I(X_1) + \dots + I(X_N) | X_1 \neq g, \dots, X_N \neq g]$$

$$= N(I(p_r)p_r + I(p_b)p_b) / (1 - p_g) = N$$

since  $I(p_r) = I(p_b) = 1$  and  $p_r + p_b = 1 - p_g$ .

- c.f.  $2N$  bits with lossless code

# Lossy Coding

Example: Colours

What is probability we can reliably code a sequence of  $N$  outcomes?

$$P(x_1 \dots x_N \text{ has no } g) = P(x_1 \neq g) \dots P(x_N \neq g) = (1 - p_g)^N$$

Given we c

cted?

$$\mathbb{E}[I(X_1) + \dots + I(X_N) | X_1 \neq g, \dots, X_N \neq g]$$

$$= N(I(p_r)p_r + I(p_b)p_b) / (1 - p_g) = N$$

since  $I(p_r) = I(p_b) = 1$  and  $p_r + p_b = 1 - p_g$ .

- c.f.  $2N$  bits with lossless code

# Lossy Coding

Example: Colours

What is probability we can reliably code a sequence of  $N$  outcomes?

$$P(x_1 \dots x_N \text{ has no } g) = P(x_1 \neq g) \dots P(x_N \neq g) = (1 - p_g)^N$$

Given we c

cted?

$$\mathbb{E}[I(X_1) + \dots + I(X_N) | X_1 \neq g, \dots, X_N \neq g]$$

$$= N(I(p_r) + I(p_b)) / (1 - p_g) = N$$

since  $I(p_r) = I(p_b) = 1$  and  $p_r + p_b = 1 - p_g$ .

- c.f.  $2N$  bits with lossless code

# The Source Coding Theorem for Uniform Codes

(Theorem 4.1 in MacKay)

Our aim next time is to understand this:

The Source Coding Theorem for Uniform Codes

Let  $X$  be an ensemble with entropy  $H = H(X)$  bits. Given  $\epsilon > 0$  and  $0 < \delta < \frac{1}{N_0}$

<https://eduassistpro.github.io>

Add WeChat edu\_assist\_pr

# The Source Coding Theorem for Uniform Codes

(Theorem 4.1 in MacKay)

Our aim next time is to understand this:

The Source Coding Theorem for Uniform Codes

Let  $X$  be an ensemble with entropy  $H = H(X)$  bits. Given  $\epsilon > 0$  and  $0 < \delta < 1$ , there exists a code with  $N > N_0$  symbols such that the average number of bits per symbol is within  $\epsilon$  of  $H$  and the probability of error is at most  $\delta$ .

<https://eduassistpro.github.io>

What?

- The term  $\frac{1}{N} H(X^N)$  is the average number of bits per symbol. We can **uniformly** code all but a proportion  $\delta$
- Given a **tiny** probability of error  $\delta$ , the average bits per symbol can be made as close to  $H$  as required.
- Even if we allow a **large** probability of error we cannot compress more than  $H$  bits per symbol.

## Some Intuition for the SCT

Assignment Project Exam Help

- Don't code individual symbols in an ensemble; rather consider sequences of length  $N$ .

- As le  
seq

<https://eduassistpro.github.io>

Add WeChat edu\_assist\_pr

- Thus, we can get by with essentially assigning —  
each typical sequence
